

EFCore Example

Paulo Vieira

2020

How does it work?

Product

```
public class Product
{
    public int ProductID { get; set; }

    [Required] [StringLength(40)]
    public string ProductName { get; set; }

    [Column("UnitPrice", TypeName = "money")]
    public decimal? Cost { get; set; }

    [Column("UnitsInStock")]
    public short? Stock { get; set; }

    public bool Discontinued { get; set; }
}
```

DbContext

Usage

```
using (var db = new StarterStoreContext())
{
    IQueryable<Product> products = db.Products;

    foreach (Product p in products) {
        Console.WriteLine($"{p.ProductName} has {p.Stock} units left.");
    }
}
```

Debug?
